

Relationship between the Constructors of Parent and Child

Previously, we had made the following Classes.

```
Student
```

name session isDayScholar EntryTestMarks HSMarks

calculateMerit(

The general class is called Parent class

Hostelite

RoomNumber
isFridgeAvailable
isInternetAvailable

getHostelFee()

The specific classes are called Child classes

DayScholar

PickUpPoint
BusNo
PickupDistance

getBusFees()

Now, the question is whether the class attributes of the Student Class should be Public or Private?

```
Student
```

```
name
session
isDayScholar
EntryTestMarks
HSMarks
```

```
calculateMerit(
```

The general class is called Parent class

Hostelite

RoomNumber
isFridgeAvailable
isInternetAvailable

getHostelFee()

The specific classes are called Child classes

DayScholar

PickUpPoint
BusNo
PickupDistance

getBusFees()

Let's see if we make them Public.

```
class Student
{
    public string name;
    public string session;
    public bool isDayScholar;
    public int EntryTestMarks;
    public int HSMarks;
}
```

Inheritance: Any Problem in This?

Let's see if we make them Public.

```
class Student
{
    public string name;
    public string session;
    public bool isDayScholar;
    public int EntryTestMarks;
    public int HSMarks;
}
```

Inheritance: Any Problem in This?

Let's see if we make them Public. They will be accessed in the Child class. But any class will access them as well by creating the object of Student Class.

```
class Student
{
    public string name;
    public string session;
    public bool isDayScholar;
    public int EntryTestMarks;
    public int HSMarks;
}
```

Let's see if we make them Private.

```
class Student
{
    private string name;
    private string session;
    private bool isDayScholar;
    private int EntryTestMarks;
    private int HSMarks;
}
```

Inheritance: Any Problem in This?

Let's see if we make them Private.

```
class Student
{
    private string name;
    private string session;
    private bool isDayScholar;
    private int EntryTestMarks;
    private int HSMarks;
}
```

Inheritance: Any Problem in This?

Let's see if we make them Private. Outside classes will not be able to access them. But the Child class will not be able to access the attributes also.

```
class Student
{
    private string name;
    private string session;
    private bool isDayScholar;
    private int EntryTestMarks;
    private int HSMarks;
}
```

Solution

Object Oriented Programming also have another Access modifier.

- 1. Public
- 2. Private
- 3. Protected

Encapsulation

Access modifiers are an integral part of object oriented programming. Access modifiers are used to implement Encapsulation of OOP. Access modifiers allow you to define who does or who doesn't have access to certain features.

Modifier	Description
public	There are no restrictions on accessing public members.
private	Access is limited to within the class definition. This is the default access modifier type if none is formally specified
protected	Access is limited to within the class definition and any class that inherits from the class

When child class inherits parent class, it receive all the protected and public attributes and functions of the parent class.

Student

```
# name
# session
# isDayScholar
# EntryTestMarks
# HSMarks
```

+ calculateMerit()

Hostelite

- RoomNumber
- isFridgeAvailable
- isInternetAvailable
- + getHostelFee()

DayScholar

- PickUpPoint
- BusNo
- _

PickupDistance

+ getBusFees()

```
class Student
   protected string name;
    protected string session;
    protected bool isDayScholar;
    protected int EntryTestMarks;
    protected int HSMarks;
    public void setName(string name)...
    public void setSession(string session)...
    public void setIsDayScholar(bool isDayScholar)...
    public void setEntryTestMarks(int EntryTestMarks)...
    public void setHSMarks(int HSMarks)...
    public string getName()...
    public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
       double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
       double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

Object of Hostelite class have all the protected and public attributes and functions of Student class that it has inherited

```
class Hostelite : Student
    private int RoomNumber;
   private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable) . . .
    public int getRoomNumber()...
   public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee;
```

Driver Program

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
       double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    std.setName("Ahmad");
    std.setRoomNumber(12);
    Console.WriteLine(std.getName() + " is
allocated Room " + std.getRoomNumber());
    Console.ReadKey();
}
```

Driver Program

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
       double merit = 0.0;
        // Code to calculate merit
        return merit;
```

Ahmad is allocated Room 12

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    std.setName("Ahmad");
    std.setRoomNumber(12);
    Console.WriteLine(std.getName() + " is
allocated Room " + std.getRoomNumber());
    Console.ReadKey();
}
```

Child Inherits Parent's Legacy

It means Child Class gets the access of all the public and protected attributes and functions of its Parent Class.

Child Class uses all the public and protected attributes and functions of its Parent Class as its own.

Child Inherits Parent's Legacy

Now, let's see what is the relationship of Parent and Child Constructors because the constructors are automatically called.

What will be the output after the execution of the main?

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student()
       Console.WriteLine("Parent Constructor");
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable) ...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    Console.ReadKey();
}
```

Activity What will the main?

What will be the output after the execution of

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student()
       Console.WriteLine("Parent Constructor");
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable) ...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    Console.ReadKey();
}
```

It will print "Parent Constructor" on the screen

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
                                   Parent Constructor
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student()
       Console.WriteLine("Parent Constructor");
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
       double merit = 0.0;
       // Code to calculate merit
       return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable) ...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    Console.ReadKey();
}
```

But Why?

```
It will print "Parent Constructor" on the screen.
```

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
                                   Parent Constructor
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student()
       Console.WriteLine("Parent Constructor");
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
       double merit = 0.0;
       // Code to calculate merit
       return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable) ...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
    Hostelite std = new Hostelite():
    Console.ReadKev();
```

Child Inherits Parent's Legacy

Whenever we create the object of child class it automatically calls the default constructor of parent class.

Let's add the Default Constructor inside the child class as well.

Activity of the main?

Now, What will be the output after the execution of the main?

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student()
       Console.WriteLine("Parent Constructor");
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public Hostelite()
        Console.WriteLine("Child Constructor");
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee;
static void Main(string[] args)
```

Hostelite std = new Hostelite();

Console.ReadKey();

Activity of the main?

Now, What will be the output after the execution of the main? | Class Hostelite : Student | Class Hostelite : Stu

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student()
       Console.WriteLine("Parent Constructor");
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public Hostelite()
        Console.WriteLine("Child Constructor");
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee;
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    Console.ReadKey();
```

Activity Child Constructor. Class Hostelite: Student

It will call the Parent Constructor and then the

```
class Student
                               Parent Constructor
   protected string name;
                                Child Constructor
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student()
       Console.WriteLine("Parent Constructor");
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public Hostelite()
        Console.WriteLine("Child Constructor");
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee;
static void Main(string[] args)
```

Hostelite std = new Hostelite();

Console.ReadKey();

Child Inherits Parent's Legacy

Whenever we create the object of child class it automatically first calls the default constructor of parent class and then its own constructor.

Now Let's add a Parameterized Constructor inside the Parent class.

What will be the Output?

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student(string name)
       this.name = name;
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable) ...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    Console.ReadKey();
}
```

What will be the Output?

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student(string name)
       this.name = name;
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable) ...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    Console.ReadKey();
}
```

This will give us Compile time error as we are not passing the name.

```
There is no argument given that corresponds to the required formal
class Student
                parameter 'name' of 'Student.Student(string)'
    protected string name;
    protected string session;
    protected bool isDayScholar;
    protected int EntryTestMarks;
    protected int HSMarks;
    public Student(string name)
        this.name = name;
    public void setName(string name)...
    public void setSession(string session)...
    public void setIsDayScholar(bool isDayScholar)...
    public void setEntryTestMarks(int EntryTestMarks)...
    public void setHSMarks(int HSMarks)...
    public string getName()...
    public double calculateMerit()
        double merit = 0.0;
        // Code to calculate merit
        return merit;
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable) ...
    public int getRoomNumber()...
    public int getHostelFee()
        int fee = 0;
        // Code to calculate fee
        return fee:
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite();
    Console.ReadKey();
}
```

Solution?

So, how can we explicitly pass the parameters in the parameterized constructor of the parent class through child class?

We use the base keyword to call the parameterized constructor of parent Class

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student(string name)
       this.name = name;
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()...
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public Hostelite(string name): base (name)
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()...
static void Main(string[] args)
    Hostelite std = new Hostelite("Ahmad");
    Console.WriteLine(std.getName());
    Console.ReadKev();
```

We use the base keyword to call the parameterized constructor of parent Class

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student(string name)
       this.name = name;
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()...
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public Hostelite(string name): base (name)
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable) ...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()...
static void Main(string[] args)
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite("Ahmad");
    Console.WriteLine(std.getName());
    Console.ReadKey();
}
```

More than one Parameter

Similarly, we can explicitly pass more than one parameters in the parameterized constructor of the parent class through child class using the base keyword.

We use the base keyword to call the parameterized constructor of parent Class

```
class Student
   protected string name;
   protected string session;
   protected bool isDayScholar;
   protected int EntryTestMarks;
   protected int HSMarks;
   public Student(string name, string session)
       this.name = name:
       this.session = session:
   public void setName(string name)...
   public void setSession(string session)...
   public void setIsDayScholar(bool isDayScholar)...
   public void setEntryTestMarks(int EntryTestMarks)...
   public void setHSMarks(int HSMarks)...
   public string getName()...
   public double calculateMerit()...
```

```
class Hostelite : Student
    private int RoomNumber;
    private bool isFridgeAvailable;
    private bool isInternetAvailable;
    public Hostelite(string name, string
session): base (name, session)
    public void setRoomNumber(int RoomNumber)...
    public void setIsFridgeAvailable(bool
isFridgeAvailable)...
    public void setIsInternetAvailable(bool
isInternetAvailable)...
    public int getRoomNumber()...
    public int getHostelFee()...
```

```
static void Main(string[] args)
{
    Hostelite std = new Hostelite("Ahmad",
"2021");
    Console.ReadKey();
}
```

Self Assessment: Inheritance

Implement the Following Classes

MountainBike

- seatHeight: int
- + MountainBike(int seatHeight, int cadence, int speed, int gear)
- + void setSeatHeight(int seatHeight)

Bicycle

- # cadence: int
 # gear: int
 # speed: int;
- + Bicycle(int cadence, int speed, int gear)
- + void setCadence(int cardence)
- + void setGear(int gear)
- + void applyBrake(int decrement)
- + void speedUp(int increment)
